

Back to Black — Mustard Dynamics

Memorial Hall · DiGiCo Quantum 225 · 2026-07-16 · these are the values now written into **Back to Black.ses**

These are the dynamics from the deep-build worksheets, now live in the show file. Compressors are enabled with the reasoned model, ratio, and timing. † **The threshold is a documented starting point** (assumes ~-6 dBFS program peaks); dial it at soundcheck to the **GR** target in the same row. Attack/release are in milliseconds.

Two deliberate omissions. Ch 12 GTR 121 (Royer ribbon) and the ambient/room mics (23–32) carry **no** dynamics — the ribbon rides the SM57 blend and the room pair is glue. Ch 16 REINE (lead vocal) has its **1176 comp only**; the spec'd downward expander was left off per your call — add it by hand on the desk if you want it (it'd be a shallow-range Gate).

Gates are all range-limited, never full mutes — the kit stays glued, per the one-mic reference. The hat is a **ducker**, not a gate. Floor tom release is long (400 ms) so it rings under the ballads.
