

KB SOP Download Links — Debug Handoff

Session: 2026-06-14 | Nyquist → Brian

The Problem

Every SOP download link on `kb.tinydoorstudios.com/sops` returns HTTP 404. Links follow the pattern: `/assets/sops/{venue}/{filename}.pdf`. Files exist on the server. Goal: logged-in users on any device can download any SOP.

Infrastructure Map

Layer	Host / Service	Details
Cloudflare CDN	Edge	Proxies all traffic; cf-cache-status: DYNAMIC
cloudflared tunnel	n8n VM 192.168.200.84	Tunnel ID: b1e6581d-4384-4fbe-b960-a156760a2860 Config: /etc/cloudflared/config.yml Service: systemd, running
nginx (landing)	n8n VM (Docker) --network host	nginx:alpine, host network mode Port 8088, config: /opt/landing/nginx.conf Mounted: /opt/kb-assets → /kb-assets
Wiki.js	Proxmox LXC CT 101 192.168.200.126:3000	Wiki.js v2, /opt/wikijs/

What Is Confirmed Working

nginx config is correct. `nginx -T` confirms the active in-memory config has the right location block:

```
server_name kb.tinydoorstudios.com; location /assets/ { alias /kb-assets/; add_header Content-Disposition attachment; }
```

Direct curl to nginx returns the PDF: curl from inside the n8n VM to port 8088 with the correct Host header returns HTTP 200, application/pdf, 3,284,128 bytes. The files exist and nginx serves them correctly.

cloudflared config (on disk) is correct: `/etc/cloudflared/config.yml` has:

```
- hostname: kb.tinydoorstudios.com service: http://127.0.0.1:8088
```

Bots reach nginx via cloudflared. ClaudeBot's request for `/robots.txt` and `/sitemap.xml` appeared in the nginx access log, proving cloudflared CAN route through nginx.

What Fails

Every public request to `https://kb.tinydoorstudios.com/assets/sops/*.pdf` returns a Wiki.js 404. Confirmed by response headers:

```
HTTP/2 404 content-type: text/plain; charset=utf-8 content-length: 9 (body is
literally 'Not found') etag: W/"9-0gXL1ngzMqISxa6S1zx3F4wtLyg" ← Express.js ETag, 9
bytes x-frame-options: deny ← Wiki.js security header x-xss-protection: 1;
mode=block ← Wiki.js security header cf-cache-status: DYNAMIC ← NOT a Cloudflare
cache hit
```

These `/assets/` PDF requests do NOT appear in the nginx access log. They go directly to Wiki.js, bypassing nginx entirely.

Things Already Tried (All Failed)

Action	Result
Added location <code>/assets/</code> block to <code>nginx.conf</code>	Already present; <code>nginx -T</code> confirms it's active
<code>nginx -t + reload</code>	Config valid; reloaded OK; direct curl works
Added <code>originRequest.httpHostHeader</code> to cloudflared config	Still 404 publicly
Restarted cloudflared multiple times	Fresh process loads correct config; still 404
Verified files exist at <code>/opt/kb-assets/sops/{venue}/</code>	All files present and readable
Verified Docker port bindings	<code>{}</code> — container uses host network, port 8088 on host

Most Likely Root Cause

The Cloudflare dashboard has a Public Hostname route for `kb.tinydoorstudios.com` that overrides the local `config.yml`. This dashboard-level route points directly to Wiki.js (`http://192.168.200.126:3000`), bypassing nginx completely. Dashboard routes take priority over local cloudflared ingress rules.

Evidence: SOME requests (bots, non-PDF paths) reach nginx. PDF `/assets/` requests do not. There may be a path-specific rule or Worker in the Cloudflare dashboard routing `/assets/*` differently.

Next Steps — What to Check

Step 1: Check the Cloudflare dashboard

Go to `dash.cloudflare.com` → Zero Trust → Networks → Tunnels. Find tunnel `b1e6581d-4384-4fbe-b960-a156760a2860` → click it → Public Hostnames tab. Look for a `kb.tinydoorstudios.com` entry. If the service there shows `http://192.168.200.126:3000` (Wiki.js directly), THAT is the problem. Change it to `http://127.0.0.1:8088` (nginx).

Step 2: Check for Cloudflare Workers

dash.cloudflare.com → Workers & Pages. See if any Worker is deployed to kb.tinydoorstudios.com or tinydoorstudios.com. A Worker can intercept requests before they reach the tunnel. If one exists, review what it does with /assets/ paths.

Step 3: Check for Cloudflare Page Rules

dash.cloudflare.com → tinydoorstudios.com → Rules → Page Rules. Any rule matching kb.tinydoorstudios.com/assets/* could redirect or forward to Wiki.js.

Alternative fix if Cloudflare dashboard can't be accessed

Serve files directly from Wiki.js instead of through nginx. Put the SOP PDFs inside the Wiki.js container's static assets directory (/opt/wikijs/data/assets/ or similar) so Wiki.js serves them natively at /assets/. This eliminates the nginx layer and works regardless of Cloudflare routing.

Scripts Built (all in _tools/)

Script	What It Does
Nginx Full Config Dump.command	Runs nginx -T inside landing container; shows full active config
Debug Assets 503.command	Lists /kb-assets files, permissions, curl with Host header
Fix Nginx Assets Location.command	Injected /assets/ location block (already present)
Check Cloudflared Routing.command	Checks cloudflared config; curls nginx direct, Wiki direct, public URL
Check Nginx Access Log.command	Makes public request then checks nginx log to see if it arrived
Restart Cloudflared Fix.command	Restarts cloudflared; verifies public URL
Fix Cloudflared Host Header.command	Added httpHostHeader to cloudflared config; restarted

Bottom line: nginx is correct, cloudflared config is correct, files are there. The block is upstream of everything — in the Cloudflare dashboard itself. Checking the Public Hostnames tab for this tunnel should resolve it in under 5 minutes.
